

Postly — Wireframes & Component Breakdown

Final project, document 2 · daily postcard generator · React + Express + Cloudinary · routes: /capture, /gallery, /streaks, /capsule

Step A — Screen map

/capture is the screen the user lands on, because the job of the app is today's postcard. The header nav is the home base and sits on all four routes, so every screen has a way back and there are no dead ends.

- **First screen:** /capture. If today's postcard already exists, the same route renders its "already done" state with a link through to the gallery.
- **Home base:** the header nav — one shared layout component, reaching all four routes from anywhere.
- **No dead ends:** both modals close back to the screen that opened them; the empty gallery links back to /capture rather than stopping.

Step B — Box sketches · 1. /capture (Capture & Generator)

DESKTOP — ≥ 1024px

PHONE — 375px

- ① **Header / nav** — shared layout, identical on all four routes.
- ② **Block 1** — date + today's status badge.
- ③ **Block 2** — dropzone; dashed = drop target, shows a spinner while uploading.
- ④ **Block 3a** — template picker, 3 repeated options.
- ⑤ **Block 3b** — caption field with char count.
- ⑥ **Block 4** — live preview, front and back, sticky on desktop.
- ⑦ **Block 5** — save action; the one primary button on the screen.
- ⑧ **Footer** — shared layout.

What stacks on a phone: the two desktop columns collapse to one; the 3-up template grid becomes a horizontally scrolling row; the preview shows one face at a time (tap to flip) instead of front and back together; the save button leaves the flow and becomes a fixed bottom bar; the nav collapses into a  drawer. Breakpoint: **1024px**.

No horizontal page scroll at 375px: the only sideways scroll is inside the template row, which is deliberate and contained.

Step B — 2. /gallery (Postcard Gallery & Detail)

DESKTOP — $\geq 1024\text{px}$

PHONE — 375px

- 1 **Toolbar** — count, caption search, sort, month filter.
- 2 **PostcardCard** repeats — built once, rendered with `.map()` + keys. Thumb + caption lines + date.
- 3 **Empty state** replaces the grid when the list is empty, and routes back to `/capture`.
- 4 **Detail modal** opens over this screen; the grid stays mounted behind it.

What stacks on a phone: the 4-across grid becomes 2 across (1 across below 400px); search and sort collapse behind a single "filters" button; the modal goes full-screen with the close button in a top bar. Breakpoints: **640px** and **1024px**.

Step B — 3. /streaks (Streak Calendar Dashboard)

DESKTOP — ≥ 1024px

PHONE — 375px

- 1 **StatTile** repeats 3x — one component, different label and value props.
- 2 **StreakHeatmap** — HeatmapCell repeats 365x; filled state comes from the postcards list.
- 3 **MonthCalendar** — CalendarDay repeats; a filled day opens the same detail modal as /gallery.
- 4 **Stats list** — all values derived from the postcards list, nothing stored separately.

What stacks on a phone: the 3-up stat row becomes one hero tile plus a 2-up row; the heatmap keeps its 7 rows but scrolls horizontally inside its own container so the page itself never scrolls sideways; the calendar and the stats list stop sitting side by side and stack. Breakpoints: **640px** and **1024px**.

Step B — 4. /capsule ("Future You" Time Capsule)

Postly — Capsule

4 Flashback — on this day last year

shuffle

Footer

1 **Intro + counts** — explains what a capsule is, since this route is not self-evident.

2 **SealCapsuleForm** — reuses the same FormField atoms as /capture.

3 **CapsuleRow** repeats; locked rows blur the thumbnail and show a countdown, ready rows get the Open button.

4 **FlashbackStrip** — reuses PostcardCard data, different arrangement.

DESKTOP — ≥ 1024px

+ New capsule

form collapsed behind this

Footer

PHONE — 375px

What stacks on a phone: the form and the vault stop sitting side by side and become one column, *reordered* so the flashback and the existing capsules come first and the seal form collapses behind a "+ New capsule" button — the form is the least-used thing on this screen. Breakpoint: **1024px**.

Layout summary — all four screens

Screen	Desktop layout (≥1024px)	Phone layout — what stacks (375px)	Navigates to
/capture	2-col grid: form left, sticky preview right	1 col; templates scroll sideways; save becomes a fixed bottom bar; nav → ☰	/gallery on save; any route via nav
/gallery	toolbar + 4-across card grid	2-across grid; search/sort collapse into "filters"	detail modal; /capture when empty
/streaks	3 stat tiles in a row; heatmap; calendar + stats side by side	hero stat + 2-up row; heatmap scrolls inside its box; calendar and stats stack	detail modal from a filled day
/capsule	2-col: seal form left, vault right; flashback full width below	1 col, reordered; seal form collapses behind a button	capsule reveal modal

Step C — Component breakdown

The busiest screen is **/capture**, so that is the one broken down. Every box drawn on page 2 became a component here. Anything that repeats — a template option, a postcard card, a stat tile, a heatmap cell — is built once and rendered in a list with keys.

<CapturePage>	page
└─ <AppLayout>	layout – wraps all four routes
└─ <Header>	organism [1]
└─ <Logo />	atom
└─ <NavLink /> × 4	atom (repeats → one component)
└─ <main>	
└─ <TodayStatusbar>	molecule [2]
└─ <DateLabel />	atom
└─ <Badge />	atom ("not made yet" / "done")
└─ <CaptureForm>	organism [3][4][5]
└─ <UploadDropzone>	molecule [3]
└─ <Thumbnail />	atom
└─ <Spinner />	atom (while Cloudinary uploads)
└─ <Button />	atom ("Choose a photo")
└─ <TemplatePicker>	molecule [4]
└─ <TemplateOption /> × 3	molecule (repeats)
└─ <FormField>	molecule [5]
└─ <Label />	atom (htmlFor → textarea id)
└─ <TextArea />	atom (+ char count)
└─ <PostcardPreview>	organism [6]
└─ <PostcardFront />	molecule ← also used in /gallery + modal
└─ <PostcardBack />	molecule ← also used in /gallery + modal
└─ <Button />	atom ("flip")
└─ <Button />	atom [7] "Save postcard", disabled until valid
└─ <Footer />	organism [8]

Level	What it is	Postly components
Atoms	smallest pieces	Button · TextArea · Input · Label · Badge · Spinner · Thumbnail · Icon · DateLabel · NavLink · HeatmapCell
Molecules	small groups of atoms	FormField · UploadDropzone · TemplateOption · TemplatePicker · PostcardFront · PostcardBack · PostcardCard · StatTile · CalendarDay · CapsuleRow · TodayStatusBar · GalleryToolbar
Organisms	whole sections	Header · Footer · CaptureForm · PostcardPreview · GalleryGrid · PostcardDetailModal · StatsRow · StreakHeatmap · MonthCalendar · CapsuleVault · SealCapsuleForm · FlashbackStrip
Page / layout	arranges organisms	AppLayout · CapturePage · GalleryPage · StreaksPage · CapsulePage

Components that repeat — built once, rendered many times

Component	Level	Appears on	Rendered as
Button	atom	all four screens + both modals	<code><Button variant="primary" onClick={...}></code>
NavLink	atom	Header, on every screen	<code>links.map(l => <NavLink key={l.to} .../>)</code>
PostcardCard	molecule	/gallery, /capsule flashback	<code>postcards.map(p => <PostcardCard key={p.id} .../>)</code>
TemplateOption	molecule	/capture	<code>templates.map(t => <TemplateOption key={t.id} .../>)</code>
StatTile	molecule	/streaks (×3)	<code><StatTile label="current streak" value={14}/></code>
HeatmapCell	atom	/streaks (×365)	<code>days.map(d => <HeatmapCell key={d.date} .../>)</code>
PostcardFront / Back	molecule	/capture preview, /gallery card, detail modal	same component, different size prop

Folder structure this gives me

```
src/
├── components/
│   ├── atoms/      Button.jsx Badge.jsx Spinner.jsx NavLink.jsx HeatmapCell.jsx ...
│   ├── molecules/  PostcardFront.jsx PostcardCard.jsx TemplateOption.jsx StatTile.jsx ...
│   └── organisms/  Header.jsx Footer.jsx GalleryGrid.jsx StreakHeatmap.jsx ...
├── layouts/        AppLayout.jsx
└── pages/          CapturePage.jsx GalleryPage.jsx StreaksPage.jsx CapsulePage.jsx
```

Rule I am holding myself to: a level only imports from the levels below it — Button never imports Header.

PostcardFront is filed as a molecule even though it looks big, because it is pure presentation and gets reused in three places.

Step D — Sanity check

Most important task, walked screen by screen: "upload today's photo, save it, then check my streak"

1. Land on /capture. TodayStatusBar reads "not made yet".
2. Drop a photo on UploadDropzone → it uploads to Cloudinary, Spinner shows, the returned secure URL lands in todayInput.imageUrl.
3. Pick a template, type a caption. PostcardPreview re-renders from todayInput on every keystroke.
4. Click **Save postcard** → one POST to Express with { imageUrl, caption, templateId }. The button stays disabled while uploadStatus === "uploading", which is how I avoid the race condition I named as my risk in the proposal.
5. On success the new record is appended to the app-level postcards list, and I am redirected to /gallery where it appears first.
6. Click **Streaks** in the nav → StreaksPage recomputes from the postcards list; the streak reads 15.

What the walkthrough caught (fixes now in the sketches above)

- **A screen I had not sketched:** the "already done today" version of /capture. Same route, same layout, but the form is swapped for today's finished postcard and a link to the gallery.
- **Two empty states:** /gallery and /capsule with zero records. Both are drawn as dashed boxes now, and both point back to /capture instead of dead-ending.
- **A missing confirm:** delete was one click with no way back. A confirm step now lives inside the detail modal.
- **A missing piece of state:** nothing owned "is the upload still in flight", which is exactly what the save button needs to read. Added as uploadStatus below.

Every piece of state from the proposal has a component that owns it

State	Shape	Owned by	Changes when
Postcards list	[{ id, imageUrl, caption, templateId, createdAt }]	App — top-level state / context; read by GalleryGrid, StreaksPage, CapsuleVault	a postcard is saved or deleted
Today's input	{ imageFile, imageUrl, caption, selectedTemplate }	CapturePage — local, passed down to CaptureForm and PostcardPreview	the user uploads, picks a template, or types
Streak stats	{ currentStreak, totalPostcards, historyDates: [] }	StreaksPage — derived with useMemo, never stored	the postcards list changes
Selected postcard	id null	GalleryPage — controls the detail modal	a card, or a filled heatmap day, is clicked
Upload status (new)	"idle" "uploading" "error"	UploadDropzone, lifted to CapturePage so it can gate the save button	a Cloudinary upload starts, finishes, or fails
Capsules (new)	[{ id, postcardId, message, unlockAt }]	App — same context as postcards; read by CapsuleVault	a capsule is sealed or opened

Streak stats stay *derived* rather than stored: the single source of truth is the postcards list, so deleting a postcard can never leave the streak counter wrong.

What carries into the build

- The screen map becomes `<Routes>` — four `<Route>` elements plus the shared `AppLayout` that holds the nav.
- Every labelled box becomes one file in `src/components/`, in the atomic folder listed on page 6.
- Every "what stacks on a phone" note becomes a media query at the 640px and 1024px breakpoints carried into the design system (document 3).
